

Analyzing and Influencing Carbon Sequestration in Harvested Wood Products

Alan Arnholt, Ben Jones, Hannah X Laws, Kelly Loucks, Eric Marland, Andrew Sullivan

Department of Mathematical Sciences

Abstract

- Information is intended to aid in international discussions and any agreements about managing greenhouse gas emissions and sinks.
- Also provides national level methods and estimates of carbon sinks and emissions associated with HWP.
- The package provides quick accessibility, allowing data to be updated, modified, and manipulated with ease.

Introduction

- Sequestration of carbon in forests is a process that can pull large quantities of carbon out of the atmosphere or prevent its release to the atmosphere, 87% of total CO₂ removals in 2014. Carbon mitigation efforts have thus focused much attention on reforestation, forest management, and forest based products. According to the most recent report to the **UNFCCC**, an estimated 18.7% of the total carbon in woody materials is contained in harvested wood (**HWP and SWDS**).
- The amount of carbon in **HWP** and **SWDS** depend on how much wood is harvested, what types of products are produced, how the products are used, the lifetime of the wood products, and how the wood is processed at the end of its primary product lifetime.

Sources of Data and Equations

- Input data from reports by Hair, Ulrich, Howard, Ince, etc.
- The Production Approach is:
$$\frac{44}{12} * \left(-\Delta C_{HWP\ IU\ DH} - \Delta C_{HWP\ SWDS\ DH} \right) \quad (1)$$
- $\frac{44}{12}$ converts Carbon to CO₂
- $\Delta C_{HWP\ IU\ DH}$ is change in stock of HWP in use from domestic harvest
- $\Delta C_{HWP\ SWDS\ DH}$ is change in stock of HWP in SWDS from domestic harvest

Methodology

- Most analysis done with the Production approach.
- The Production approach focuses on carbon stocks in wood harvested in the US.
- Analysis is conducted of sensitivity of input parameters, uncertainty of estimates and consequences of alternative decay distributions.

Uncertainty Analysis

- Information is intended to aid in international discussions and any agreements about managing greenhouse gas emissions and sinks.
- Also provides national level methods and estimates of carbon sinks and emissions associated with HWP.
- The package provides quick accessibility, allowing data to be updated, modified, and manipulated with ease.

Total HWP Carbon Stocks with Uncertainty

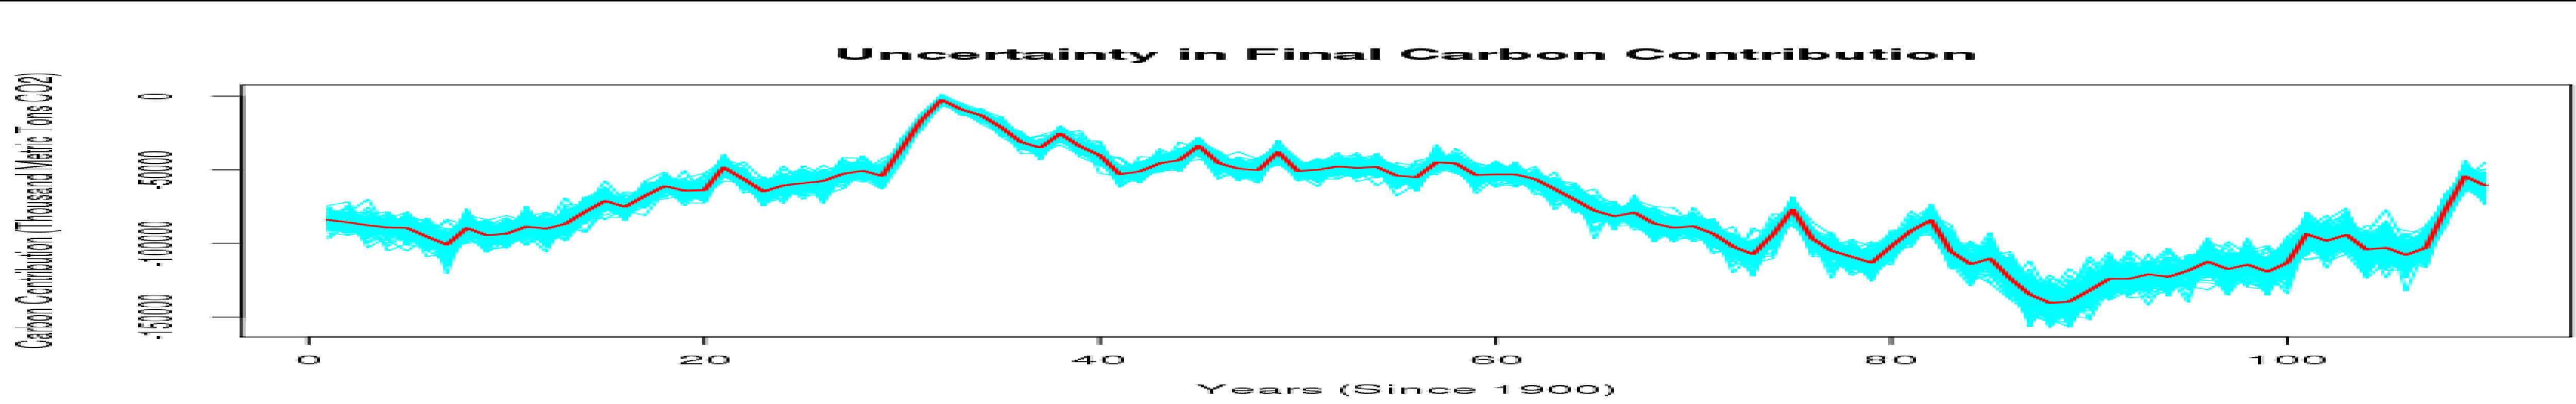

Figure: this is the caption that shows what is in the figure that explains the plot of HWP stocks and provides and envelope of uncertainty around it this is the caption that shows what is in the figure that explains the plot of HWP stocks and provides and envelope of uncertainty around it

Overall Decay

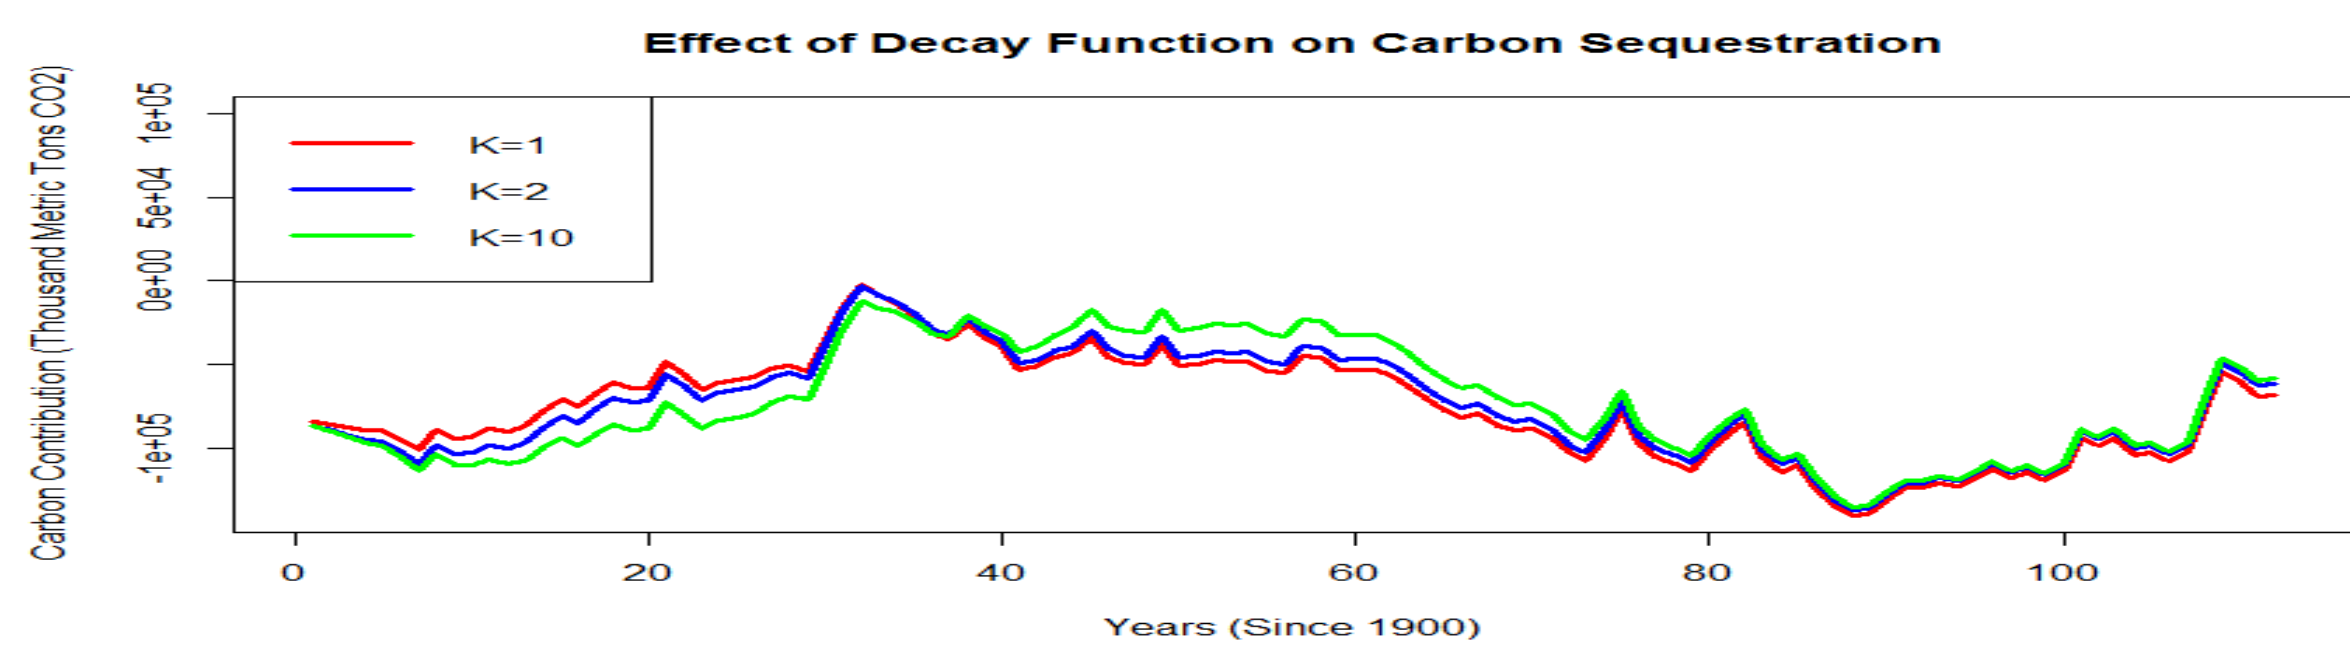

Figure: This figure shows the over effect of the decay function on Carbon Sequestration

Sensitivity Analysis

- Information is intended to aid in international discussions and any agreements about managing greenhouse gas emissions and sinks.
- Also provides national level methods and estimates of carbon sinks and emissions associated with HWP.
